Connections between income and access to health care in Kentucky

The health of Kentucky is often reported in terms of its rank among states. The commonwealth ranks low in overall health (43rd) and household income (42nd), but much higher on uninsured status (ninth). This means that many Kentuckians have health insurance coverage. Kentucky’s better uninsured ranking is largely due to the Affordable Care Act, which allowed Kentucky to expand Medicaid eligibility to cover more Kentuckians who have low income.

Since 2008, the Kentucky Health Issues Poll has asked Kentucky adults their opinions about health issues and policies as well as their personal experiences accessing health care. KHIP is co-funded by Interact for Health and the Foundation for a Healthy Kentucky.

Only 4 in 10 report very good or excellent health

KHIP asked Kentucky adults, “Would you say that in general your health is excellent, very good, good, fair or poor?” In 2019, 4 in 10 adults (40%) said their health was excellent or very good. However, differences by household income have been reported consistently since 2008. In 2019, only 3 in 10 adults in households with lower income (29%) reported very good or excellent health. That compares with more than 5 in 10 adults in households with higher income (52%).

Costs cause 1 in 5 adults to delay care

In 2019, 1 in 5 Kentucky adults (21%) reported that they or a member of their household delayed getting needed medical care because of the cost.
a decline from 2009, the first time this question was asked, when 3 in 10 adults (32%) reported delaying care. Again, responses varied by household income. Kentucky adults in households with lower income were more likely than those with higher income to report going without medical care.

1 in 4 forgo prescriptions because of the cost

In 2019, 1 in 4 Kentucky adults (26%) reported that they or a member of their household did not fill a prescription for medicine because of the cost. The first time this question was asked in 2009, slightly more Kentucky adults (34%) reported skipping prescription medications. Responses varied by household income. Kentucky adults in households with lower income were more likely than those with higher income to go without medications.

Percentage of uninsured steady since 2014

The percentage of uninsured Kentucky adults ages 18 to 64 has remained steady since 2014 at about 13%. Types of insurance coverage for Kentucky adults ages 18 to 64 were unchanged from 2018 to 2019.

In 2019, nearly 1 in 6 Kentucky adults ages 18 to 64 with health insurance (15%) were concerned that they may lose coverage in the next 12 months. In 2016, the first time this question was asked, about 1 in 5 Kentucky adults (22%) reported this. Kentucky adults ages 18 to 64 in households with lower income (22%) were more likely than those with higher income (11%) to report concerns about losing health insurance coverage.

**Type of insurance coverage for Kentucky adults ages 18-64**

*Medicare, Medicaid, military benefits and combinations of the three.

2008-2014 this includes adults who purchased their own plan, had insurance from another source or didn’t know their insurance source. 2015-2019 this also includes adults covered on a parent’s health insurance plan.
