The Ohio Health Issues Poll (OHIP) is conducted every year to learn more about the health opinions, behaviors and status of adults in Ohio. In 2017, OHIP asked Ohio adults several questions about their knowledge and opinions of needle exchange programs.

Needle exchange programs, also known as syringe exchange programs or blood-borne pathogen prevention programs, are an effective way to reduce the risk of an outbreak of infectious diseases. A needle exchange program allows people who inject drugs to exchange used syringes for new, sterile syringes. Research has shown that such programs can help reduce the spread of HIV and Hepatitis C and do not increase the frequency or initiation of drug use.1

What did OHIP find?

4 in 10 Ohio adults familiar with needle exchange programs

OHIP asked, “How familiar are you with needle exchange programs which have been implemented in a number of cities across the state of Ohio?” Four in 10 Ohio adults (40%) reported being somewhat or very familiar with these programs.

Responses to this question varied by income. Adults earning more than 138% of the Federal Poverty Guidelines (FPG)2 (46%) were more than twice as likely to be somewhat or very familiar with these programs.

Do you favor or oppose needle exchange programs?

Half of Ohio adults (50%) said they favor needle exchange programs.4 Half of Ohio adults (50%) said they favor and about 4 in 10 Ohio adults (42%) said they oppose needle exchange programs.

Adults familiar with needle exchanges more likely to favor them

OHIP asked Ohio adults if they favored or opposed needle exchange programs.4 Half of Ohio adults (50%) said they favor and about 4 in 10 Ohio adults (42%) said they oppose needle exchange programs because they feel these programs help reduce the spread of AIDS. Others oppose needle exchange programs because they feel these programs send the message that it’s okay to use illegal drugs. What about you … Do you favor or oppose needle exchange programs?”

These findings unless otherwise noted are from Interact for Health’s Ohio Health Issues Poll (OHIP) conducted June 28-July 30, 2017, by the Institute for Policy Research at the University of Cincinnati. A random sample of 836 adults throughout Ohio was interviewed by telephone. This included 430 landline telephone interviews and 406 cell phone interviews. In 95 of 100 cases, statewide estimates will be accurate to ±3.4%. There are other sources of variation inherent in public opinion studies, such as non-response, question wording or context effects that can introduce error or bias. For more information about OHIP please visit www.interactforhealth.org/ohio-health-issues-poll. If you have questions about the data in this document, please contact Susan Sprigg, Research Officer, at 513-458-6609 or ssprigg@interactforhealth.org.

3 In 2016, 138% FPG for a family of four was $33,534.
exchange programs.\(^5\) Just less than 1 in 10 (8%) are unsure.

Ohio adults who are familiar with needle exchange programs are more likely to favor them. Six in 10 Ohio adults who are very or somewhat familiar with needle exchange programs favor them (61%). This compares with 4 in 10 adults (43%) who are not very or not at all familiar with needle exchange programs. Younger adults and those who identify as Democrats are also more likely to favor these programs. (See graph.)

WHY DO WE ASK THESE QUESTIONS?

Research has found that needle exchange programs are an effective way to reduce the risk of infectious diseases among injection drug users without increasing drug use. Asking these questions helps us understand how widely information about such programs has spread through the general public in Ohio. The fact that adults more familiar with needle exchange programs are more likely to favor them may indicate that increased public education could be helpful when this tool is used to address the harms of drug use.

WHAT’S HAPPENING NOW

The State of Ohio currently has nine syringe exchange/needle exchange programs across the state.\(^6\) At these sites, users are provided with access to clean syringes and testing for HIV and Hepatitis C. Other services provided may include testing for other sexually transmitted infections, pregnancy testing, education programs and drug treatment referrals.
